Abstract
To fulfill the purpose of the study, total 40 students, included 20 Yoga students (male) and 20 Bachelor of Arts students (male) were randomly selected from different colleges of Punjab University. The subjects were ranged from 19 to 25 years of age. The purpose of the study was to find out the comparison of vital capacity among Yoga students and Bachelor of Arts students.

The parameter selected for the purpose of the study was vital capacity. The mean, standard deviation and 't' test was used to compare the parameter within the group. Data was analyzed using SPSS version 16.0 (statistical package for the social sciences, version 16.0, SPSS Inc, Chicago, USA). After the study was completed, it was found that the Yoga had significant effect on the vital capacity of Yoga students in comparison with Bachelor of Arts Students.

Keywords: Vital capacity, statistical, parameter, randomly

Introduction
Breathing is life. The ancient yogis in India knew the intimate connection between breath and mind. For example, when your mind is angry, watch your breathing. It will be disturbed and similarly if you hold your breath for long, mind will be agitated. Pranayama or control or regulation of the life force is the fourth step in the Ashtanga yoga system of Patanjali. The control of breath leads to the control of the life force or prana.

Training to yoga respiration selectively increased the respiratory sensation, perhaps through its persistent conditioning of the breathing pattern. It is based on ancient theories, observations and principles of mind-body relationships.

Substantial research has been conducted to look at the numerous health benefits of yoga postures (asana), yoga breathing (pranayama) and meditation. The physiological and psychological benefits of yoga have been presented in several studies (Bal; 2010) [1]. Yoga and pranayama may be as effective as or better than exercise at improving a variety of health-related outcome measures.

Vital capacity is a parameter of respiration. It is the amount of air forcefully expelled after a maximal inspiration. The vital capacity of a normal individual ranges from 3 to 4 liters while the trained athletes vital capacity ranges from 5 to 6 liters.

Material and Methods
Subjects
Forty randomly selected male students which included 20 Yoga Students and 20 Bachelor of Arts students from different colleges of Punjab University were volunteered to participate in the study. The subject’s age was between 19-25 years. A written consent was obtained from the subjects. All were doing Bachelor degree in arts and Yoga. The subjects were highly motivated to participate in the study.

Vital Capacity Measurement
The vital capacity of the subjects was measured by using Spiro-meter. The subjects were asked to take a deep breath and then to blow hard into mouthpiece of the Spiro-meter with a sharp blast. Three recordings were taken at one-minute intervals and the average of three highest readings was noted.
Data Analysis
Values are presented as mean values and SD. The Student paired ‘t’ test was used to compare parameters within group. Data was analyzed using SPSS Version 16.0 (statistical package for the Social Sciences, version 16.0, SPSS Inc. Chicago, IL, USA)

Results

Table 1: MEANS, SD and ‘t’ Values Of Vital Capacity (Liters) of Yoga Students and Bachelor of Arts Students

<table>
<thead>
<tr>
<th>Group</th>
<th>N</th>
<th>Mean</th>
<th>SD</th>
<th>‘t’ Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yoga Students</td>
<td>20</td>
<td>4.73</td>
<td>0.4</td>

</table>

\[ t = 0.01 \]

This table showed the mean, S.D and ‘t’ values of vital capacity of the group of Yoga Students and Bachelor of Arts Students. Yoga Students mean and S.D value has been calculated as 4.73 ± 0.4 whereas mean and S.D value of Bachelor of Arts students were found to be 3.92 ± 0.27 when ‘t’ test was applied, it has shown the 6.51** value which is significant at 0.01.

Discussion
Yoga practices are known to improve the health, reduces stress and anxiety significantly. From the results it is evident that the Yoga had significant effect on the vital capacity of the Yoga students in comparison with Bachelor of Arts Students. The findings are supported by the study conducted by Upadhyay et al. (2008). The findings are also supported by the study conducted by Bal (2008), “The study showed significant improvement in vital capacity and maximal ventilator volume with the training programme of bhas trika and anulom vilom pranayama.” The results of the present study demonstrated the beneficial effects of Yoga on pulmonary function of the respiratory system.

Conclusion
The Conclusion of the study was that the Yoga had significant effect on the vital capacity of Yoga students in comparison with Bachelor of Arts Students. Therefore, such type of Yogic Practices may be recommended for the Bachelor of Arts students to improve their physical and psychological fitness. The significant results found in the study might also help the sports person to improve their physiological efficiency.
